Congratulations on the purchase of your *Maxi-Joker 2* - helicopter.

The successor of our popular Joker-series has got some new features to increase its span of usage. From beginners training over usage in scale bodies, as photo helicopter to 3D extrem flight is everything possible without modifications.

New items are a toothed belt in the first gear reduction, a better servo linkage to the swash plate, a simpler and more efficient construction and a better protection of the flight battery. Our classic MFS rotorhead is standard like before and also the quality of all parts and the long life expectancy of the model. So flying and servicing will give you a great deal of fun for a long time.

The manual contains many detailed graphics so that you should have no problems when building the helicopter. Please take a little time to study the manual before beginning. Then you get an overview of the building process.

The kit contains some hexagon wrenches. Additionally you need the following tools:

Tools:

Thin walled socket wrenches to fit 5,5 and 7 mm nuts.

Open wrench 4,5/5,5 mm

Hexagon wrenches for 2/2,5/3 mm bolts

Hexagon wrench 4 mm a.f. (2 required for the feathering spindle)

Sharp tongs with 45° cranked head

Phillips screwdriver small

Screwdriver flat

Screw lock Loctite 243 blue

Special Tools:

Special open wrench 5,5mm for restricted access to the nuts Ord.-No. 707

Ball joint tongs e.g. Robbe S 1360

Pitch gauge e.g. Robbe S1366

Paddle gauge e.g. Robbe S1368

Lubricants:

Axial bearings: normal machine lubricant (from tool suppliers)

Autorotation coupling: grease or synthetic motor oil

The gear wheels and the belt drives don't use lubricant.

Recommended RC-equipment:

Receiver: Dual conversion PCM-system

RC-battery: 4 cells Sanyo KR 1700AU or cells with similar capacity

Swash-plate servos: Futaba S9252, S9206, S9202 or similar

Gyro: Futaba GY 401 with servo S9253/4 or GY 601 with servo S9251

If you have problems when building your model please contact us. We will help you!

And now: Much fun by building your *Maxi-Joker 2* !

Safety rules:

Radio controlled helicopters are **no toys**. A wrong use of such models can cause accidents with heavy injuries.

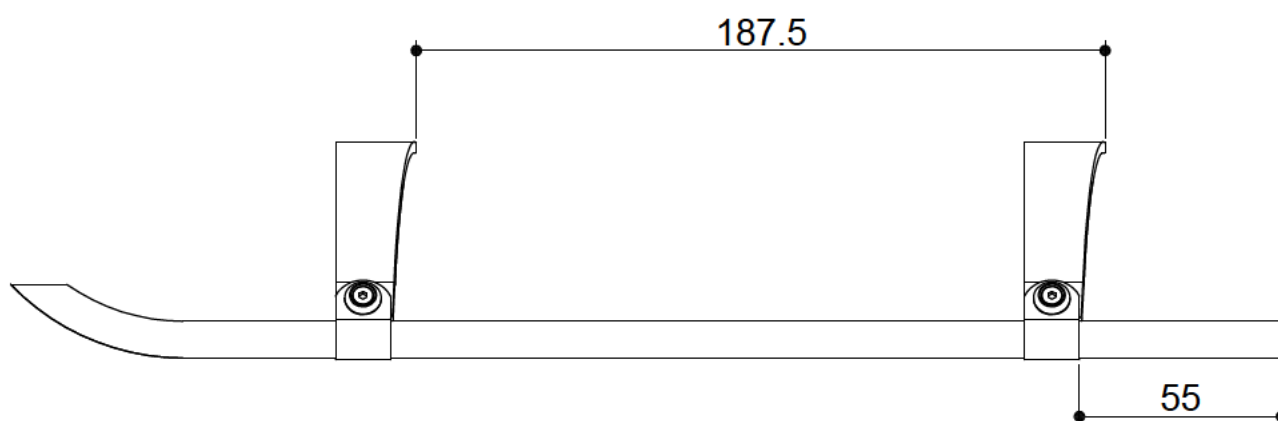

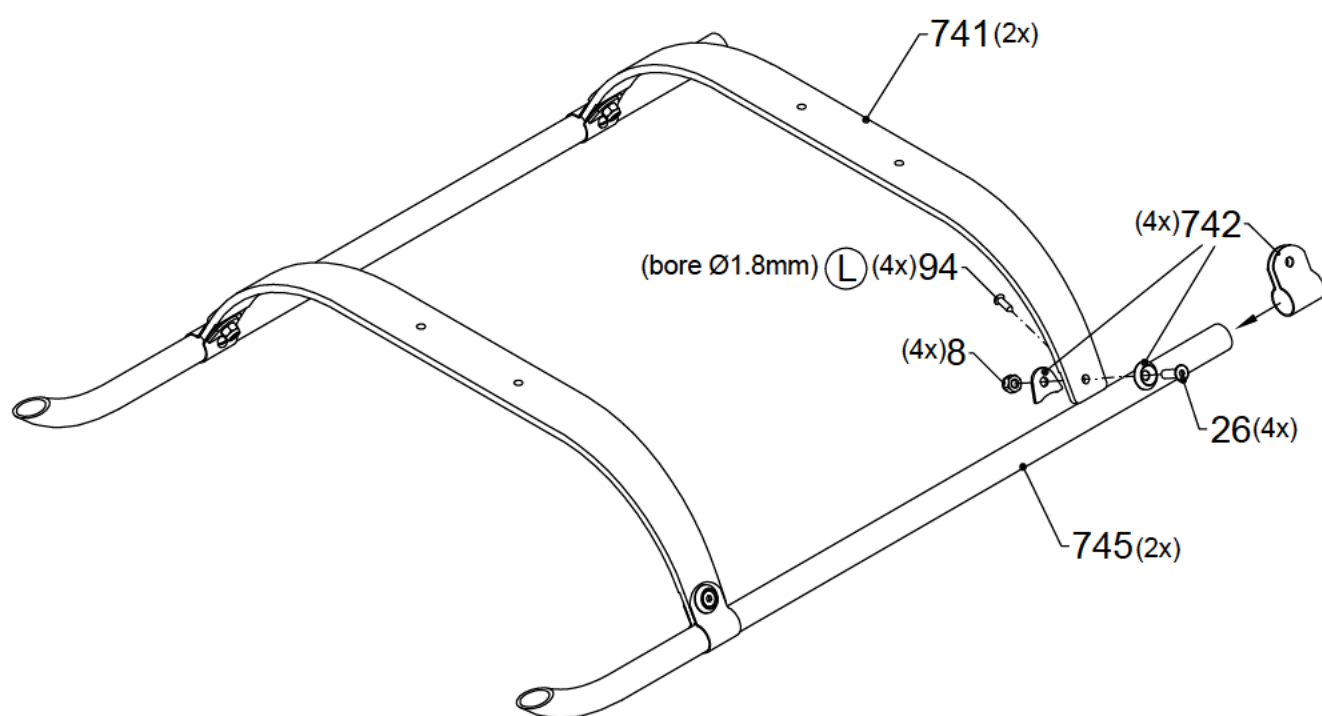

Therefore please bear following rules in your mind:

- For engine running tests on your workbench remove the complete mainrotor including all rods and the tailrotor blades. Consider that nothing can come in the tailrotor.
- You can't assess by an electric helicopter the danger of a suddenly starting engine. So remove the dangerous areas of main- and tailrotor after connecting the battery packs.
- Don't switch the controller suddenly off and on by running up. Wait some seconds if retrying.
- In hovering flight please keep a distance of at least 5 metres to the helicopter.
- Don't aim in flight persons or other creatures and keep a security distance of at least 20 metres.
- Don't fly your battery in forward flight empty, if you can't autorotate in all situations. For landing calculate a security reserve of at least 30 seconds or better one minute. Empty the battery while hovering. For safety rules for Lipo batteries please follow the rules added to the packs.
- If using Lipos add the Lipo battery just before the flight and remove it just after the flight to contain the battery always in a special metal case.
- Don't empty the battery with the last force in hovering, otherwise the battery can be damaged.
- For the first flight a partner should say you the flown time in intervals of 30 seconds so that you get a feeling for electric flight. After some time you feel an empty battery by giving full pitch for a moment. When the rotorspeed shuts down then you should search the ground for landing.
- Train autorotations with running engine as soon as possible.
- When you see that a crash is unavoidable try to stop the engine before having ground contact.

Liability exclusion:

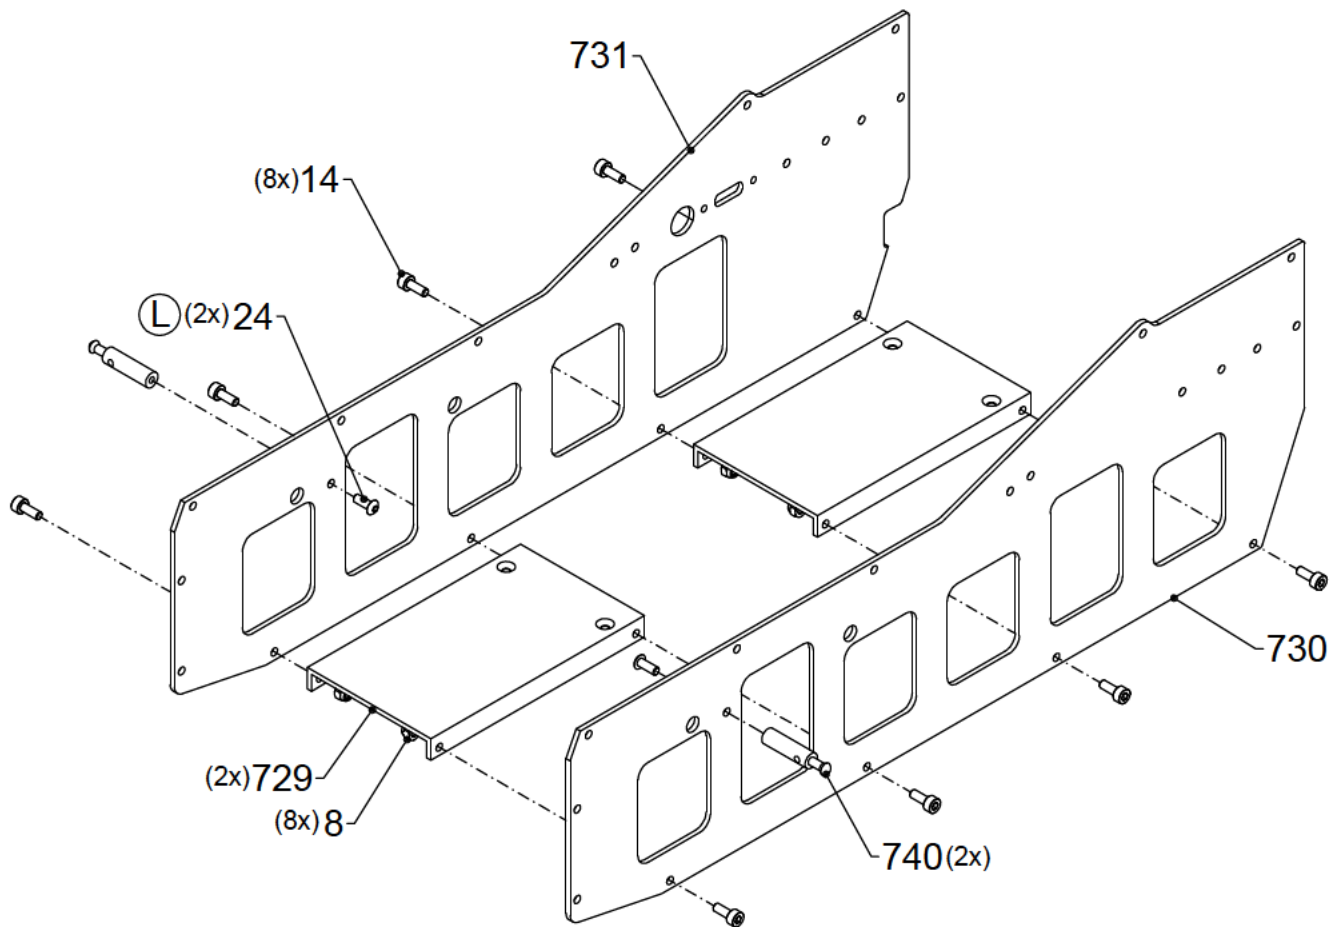

We can't observe a correct mounting, justation, maintenance and usage.
So **no guarantee is possible**.

Vellmar, in september 2004

Use oil for the first mounting of the rotorhead. DO NOT TURN, push only straight! If the hub jams, then remove, clean and try again!

- 8 = lock nut M3
- 89 = hexagon socket screw M3 x19 Spezial
- 97 = rubber grommet 3 mm

1. All servo arms and bellcranks must be vertical or horizontal.
2. Adjust pushrods (1) to level the swashplate.
3. Adjust pushrods (2) to the Hiller bridge until the antorotation ball bearing is centered in its brass lined slot.
4. Double ball links (3) between flybar and mixer arm are 42 mm long.
5. Adjust the lower ball links (4) between swash plate and mixer arms until the mixer arms are horizontal.
6. With a pitch gauge check the actual blade pitch and adjust lower ball links of rod 4 until both blades are at zero degrees pitch.

Pitch gauge

Recommended rotorspeed: 1200 - 1300 1/min

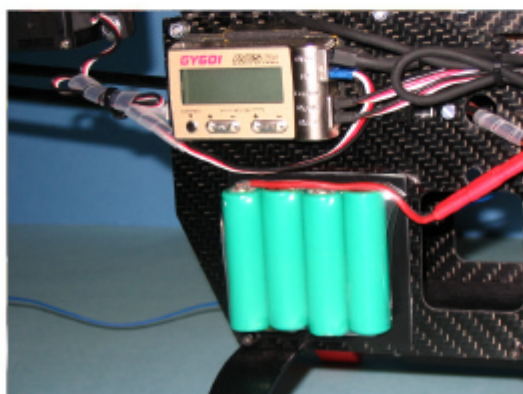

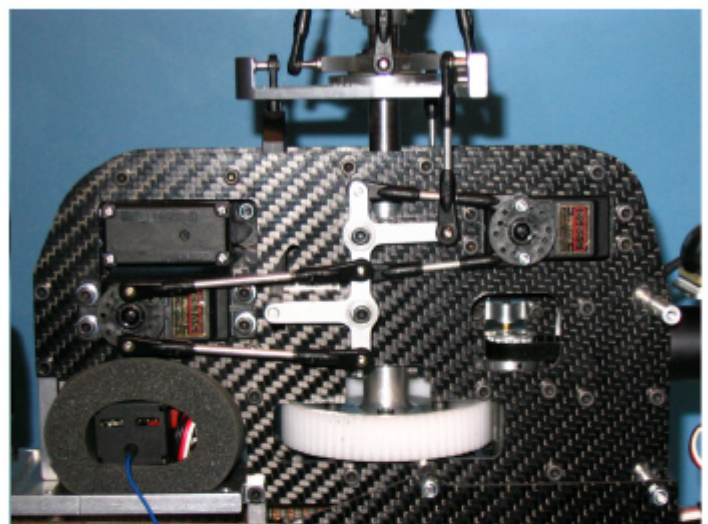

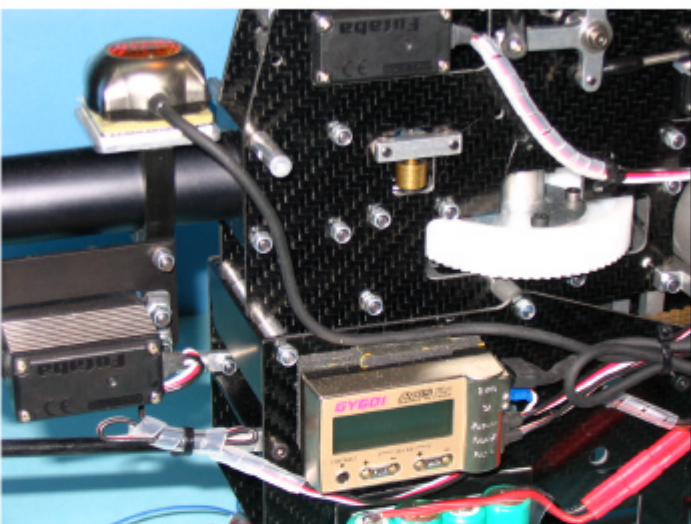

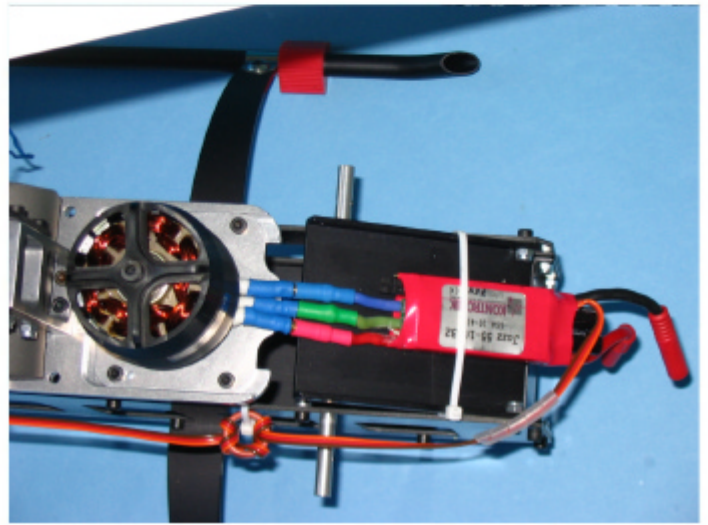

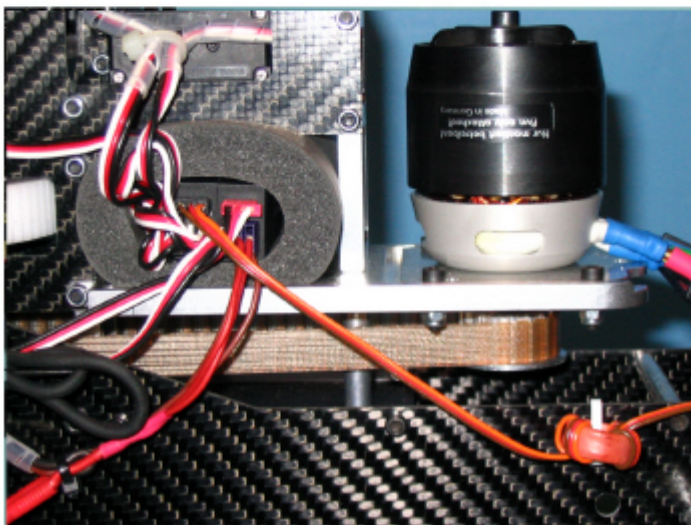

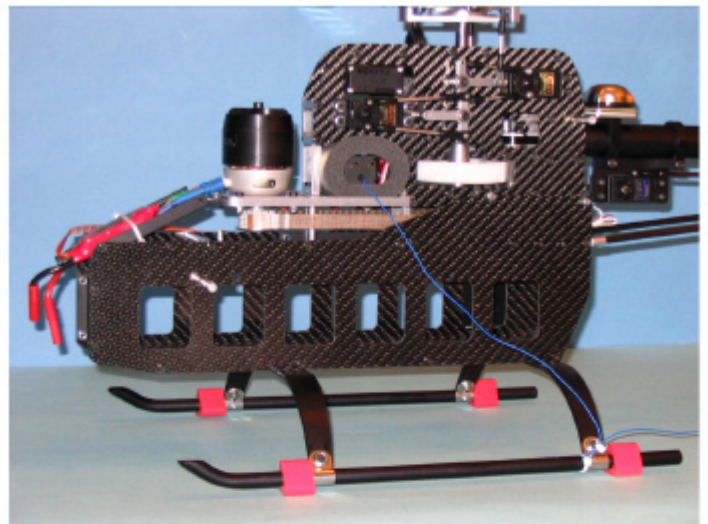

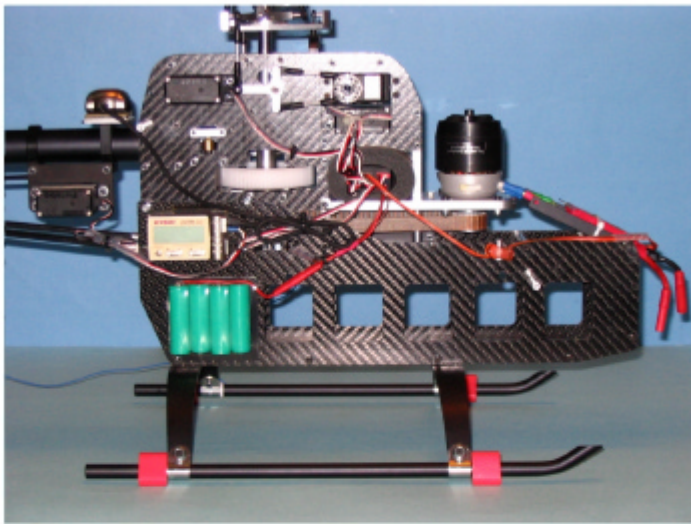

Highest allowed rotorspeed: 1400 1/min Do not exceed!

Deflections:

Elevator: Hovering 1350 1/min: 10° 25% Exponential
 Forward flight 1350 1/min: 15° 20% Exponential

Roll: Hovering 1350 1/min: 10° 20% Exponential
 Forward flight 1350 1/min: 15° 10% Exponential

Tailrotor: All Phases: +26°/-10° 30-50% Exponential
